```
In [3]: run -i BPL_YEAST_COB_Batch_explore.py
```

Model for the process has been setup. Key commands:

- par() - change of parameters and initial values
- init() - change initial values only
- simu() - simulate and plot
- newplot() - make a new plot
- show() - show plot from previous simulation
- disp() - display parameters and initial values from the last simulation
- describe() - describe culture, broth, parameters, variables with values/units

Note that both disp() and describe() takes values from the last simulation and the command process_diagram() brings up the main configuration

Brief information about a command by help(), eg help(simu)

Key system information is listed with the command system_info()

In [4]: plt.rcParams['figure.figsize'] = [20/2.54, 16/2.54]
```

```
In [5]: process_diagram()
```

No processDiagram.png file in the FMU, but try the file on disk.

Try using LP in each step
